

Cold water and dentistry. . .

. . . . name a worse combo.

We'll wait

We avoid cold water everywhere else—no one's lining up for cold showers, icy foot baths, or surprise dips off a windsurf board.

So why is it still hitting patients right in the teeth? *Shocking!*

C-1900 Forma

Comfort matters.

And one of the most overlooked sensitivities in dentistry (right up there with bill shock) is cold water on exposed roots. Not cool. . . .

Meet the fix: warm, soothing shock-free syringe water

Turn that icy blast into something patients actually tolerate—maybe even appreciate.

This self-regulating heated syringe tubing kit delivers consistent, comfortable water right where it matters.

- **Pre-connected to your choice of syringes (yay!)**
- Wired and ready to install
- Includes wall transformer
- Simple hookup to the control head master on/off signal

In short: quick install, no guesswork, no callbacks.

Patients:

No more flinching, no more cold shock—just a much more comfortable visit.

Practitioners:

One less stressor in the chair. Smoother procedures, happier patients.

Technicians (that's you):

You walk in with a simple upgrade that makes an immediate difference—and keeps delivering value every single day.

Warm water. Happy patients. Hero status unlocked
